

Project Settings

Gizmos

Currently the project settings are used for debug functionalities. The only features what's available are the gizmos which can help the developers understand what is happening in the game like showing colliders, snappoints, raycast etc.

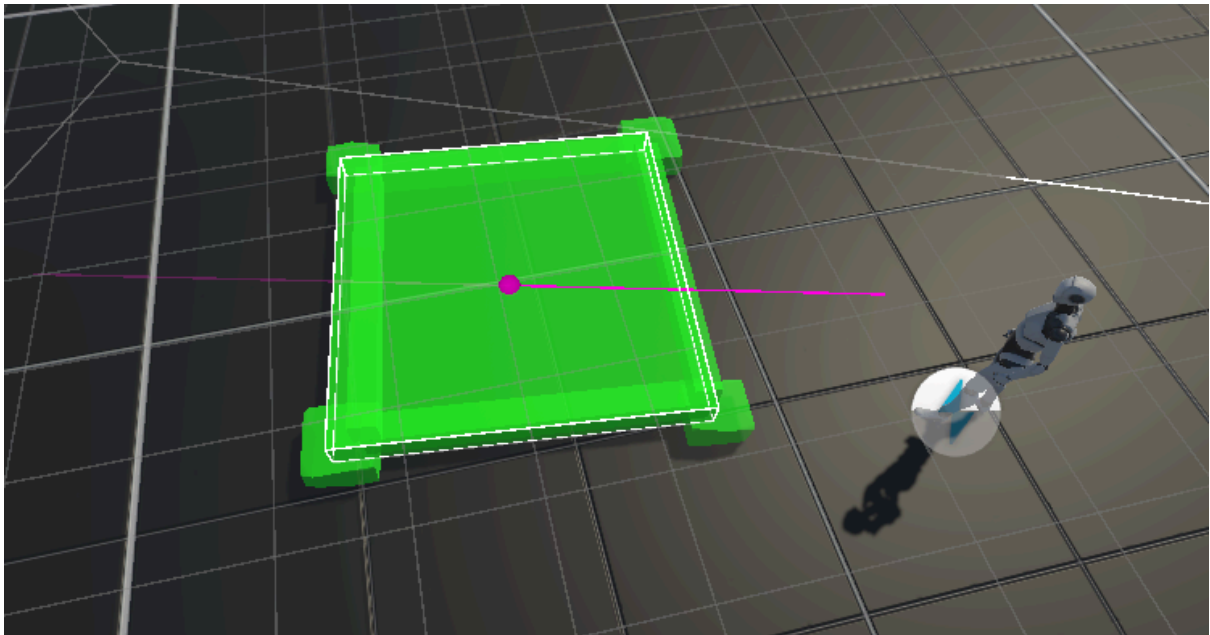

Raycast Gizmos

The Raycast Gizmos settings are visualising the raycast of the position search. It is not about all of the raycasts like what used for validations only for the position search.

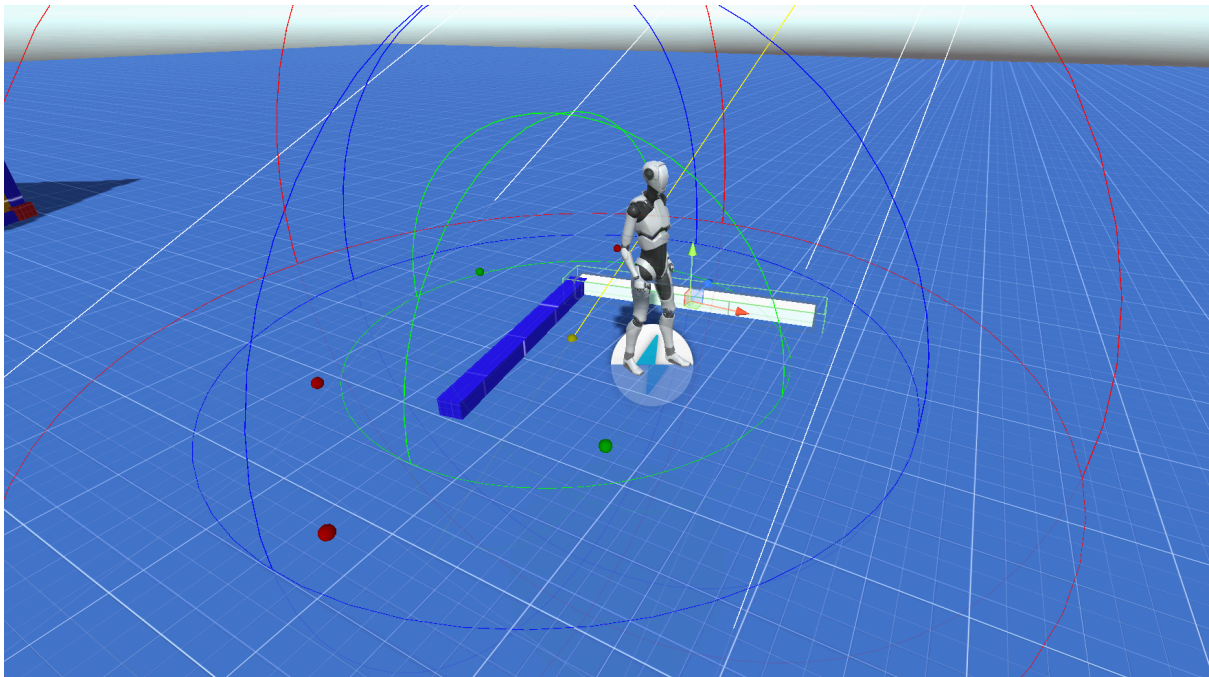

Currently two properties are available. The rycast's line and the hitpoint is represented by a sphere.

Both can be turned on or off separately and different colors can be set.

Position Search Process Gizmos

The following gizmos is for the position search.

Gizmos Draw Search Collider (Blue sphere) is a sphere where the algorithm performs the collision check and tries to find elements for snapping or for building into a prebuilt element.

Gizmos Draw Build Collider (Green sphere) is a sphere where the algorithm allows building for the elements. Even if the search sphere finds an element the new element can only snap to that if it is inside the sphere.

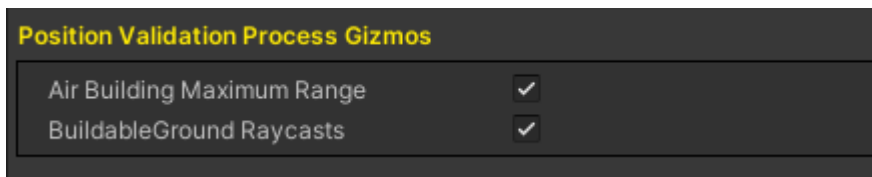

Gizmos Draw Checked BE SnapPoints (red sphere) is a sphere where the system will create small spheres to visualize the potential snapping points. The snappoint spheres are red if they are out of the build range and green if they are inside.

The first 2 sphere's size is coming from the algorithm settings:

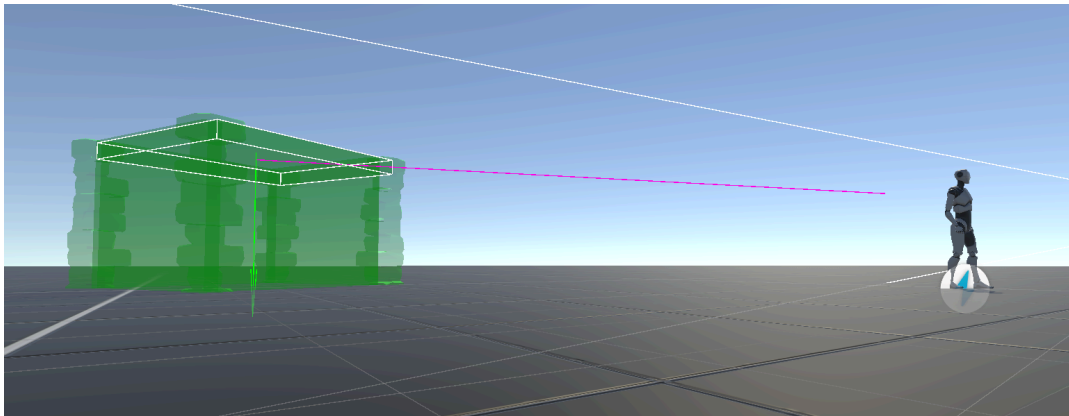

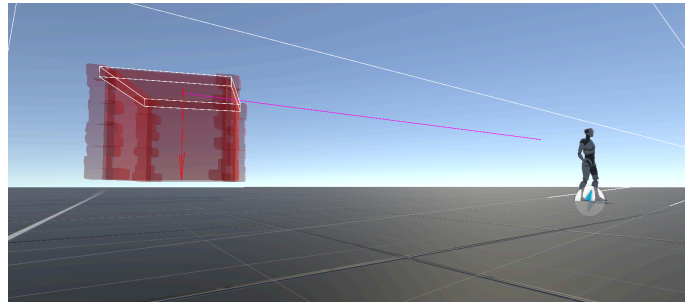

The snappoints and their sphere's size is set here in the Project Settings. This number is a percentage of the build radius. if it is 200 then it is 200% of the set build radius.

Position Validation Process Gizmos

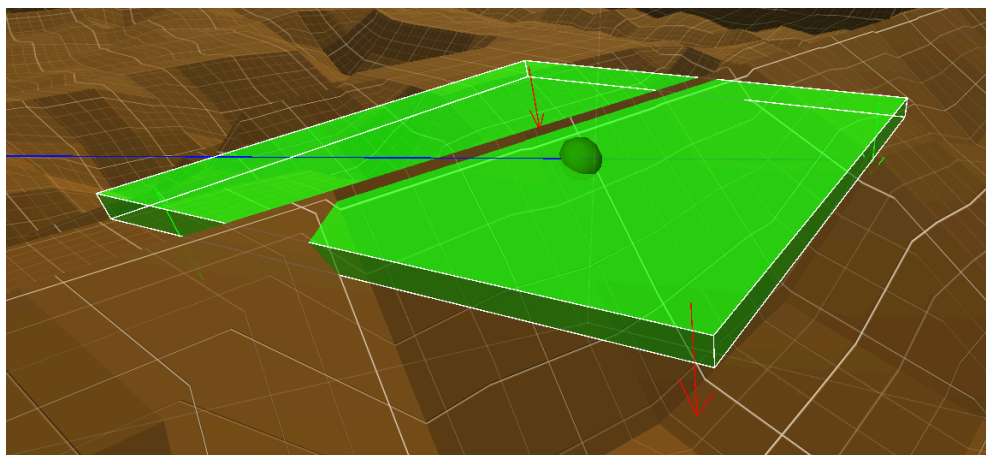

Air Building Maximum Range

It is an arrow gizmo that visualises the raycast of the Building in the air validation. It is red when it did not hit anything and the validation has failed but green when the ground was hit and the validation was successful.

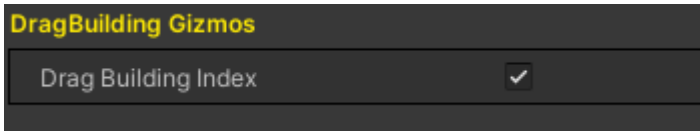

Buildable Ground Validation Raycasts

It will draw 4 arrow gizmos that visualise the raycasts of the Buildable Ground validation. They are red when they did not hit anything and green when the ground was hit.

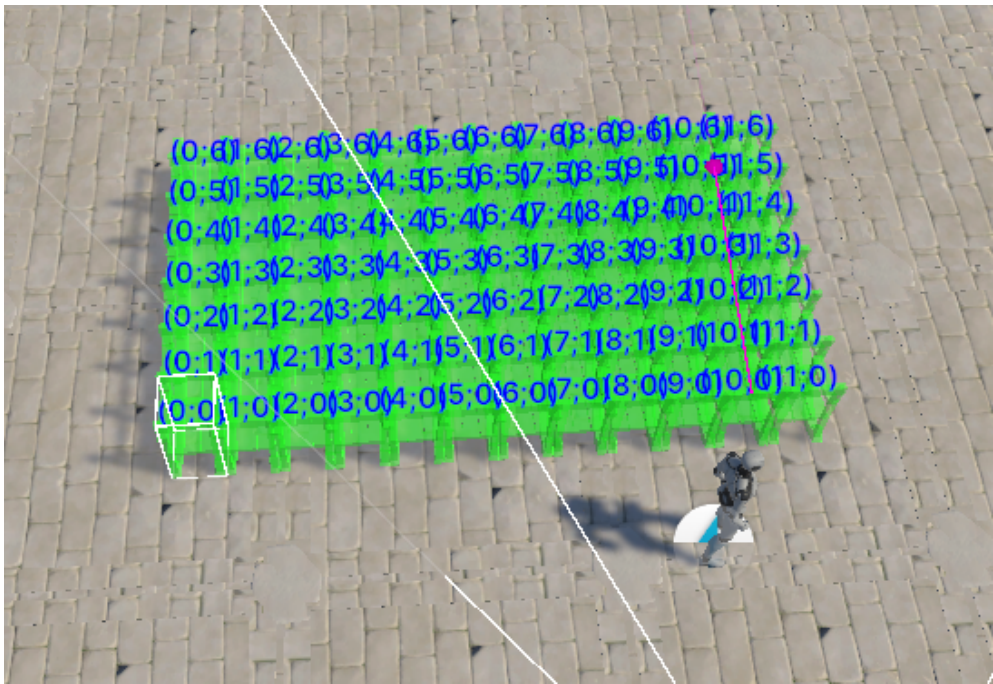

Drag Building Gizmos

Drag Building Index will write out the indexes of the temporary elements.

The text built in the following way

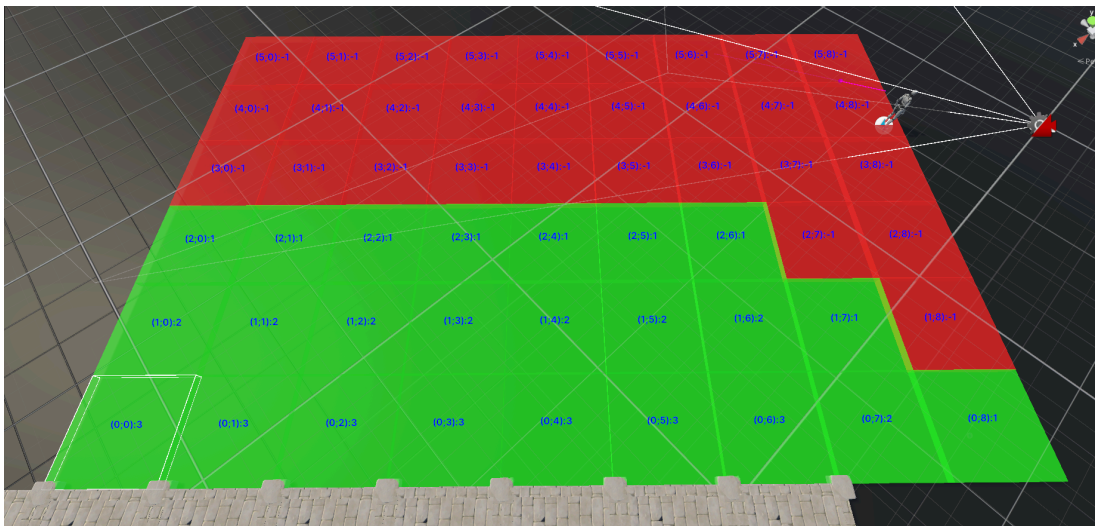

`((IndexX);[IndexZ])`

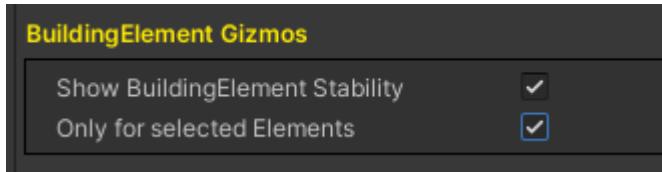

In case of AdvancedGridBuilding with stability features the stability is written out too.

The text built in the following way

`((IndexX);[IndexZ]):[Stability]`

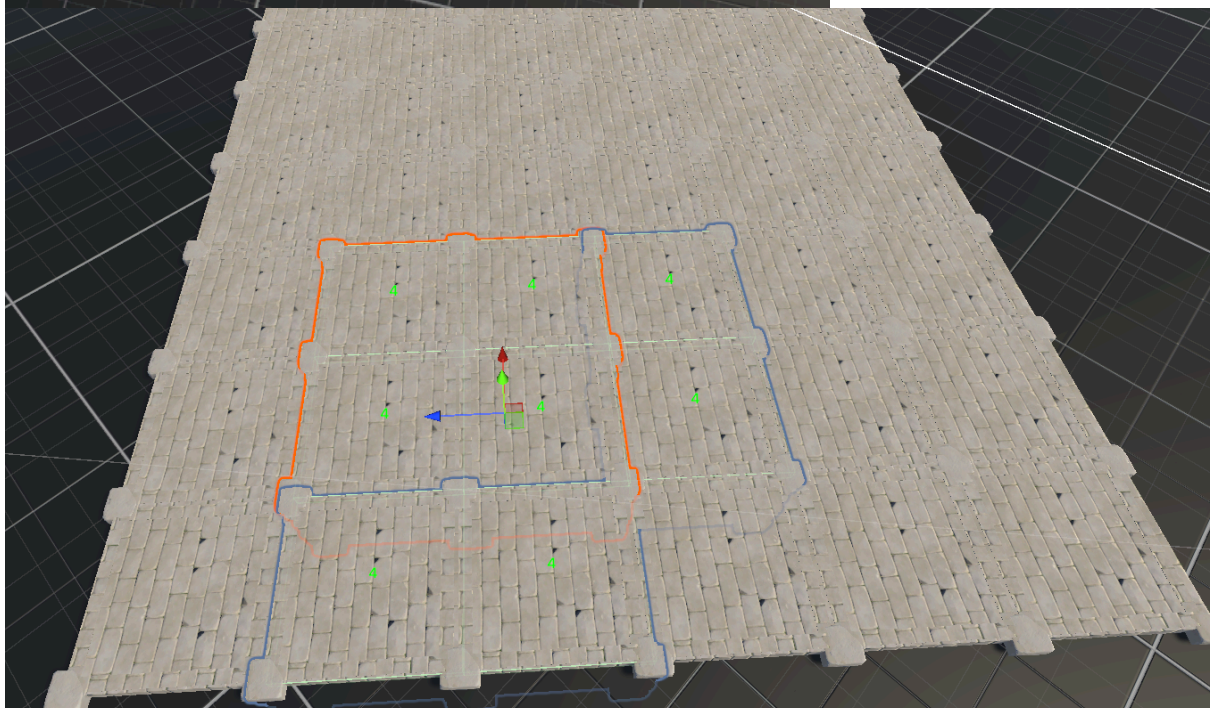

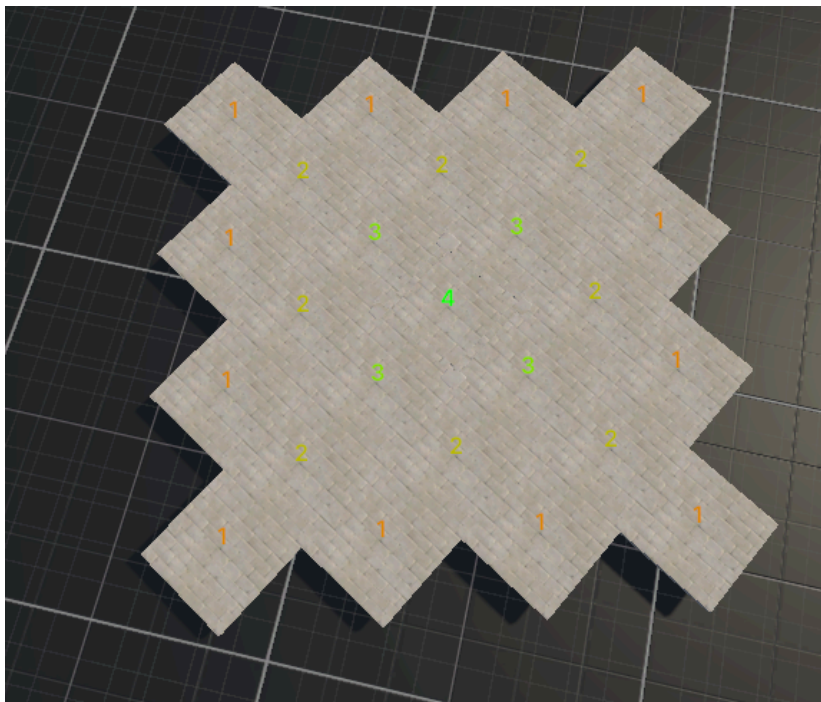

BuildingElement Gizmos

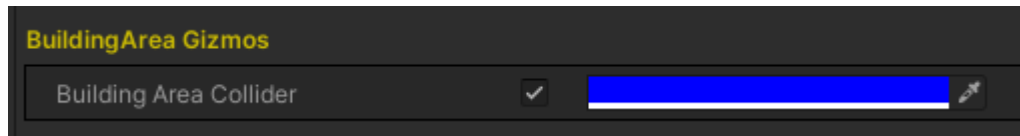

Show BuildingElement Stability will write out the stability of the elements if the Stability feature is working.

In case of **Only for selected Elements** enabled then the stability number will be only written out for the selected elements

BuildingArea Gizmos

This property will draw the area's collider even if the area is not selected.
