Building Element Creator

The BuildingElementCreator is a specific tool created for the AdvancedBuildingSystem. The goal of the creator is to create a tool that can be used to create a BuildingElement. It is made to make the developers workflow with creating the elements faster.

The creator can be found at:

UI:

A screenshot of the 'BuildingElement Creator' UI panel. The panel has a dark grey background. At the top left is a 3D wireframe cube with red, yellow, and blue faces. To its right is the title 'BuildingElement Creator'. Below the title is a form with several fields and buttons. The 'New BuildingElement Name' field contains 'NewBuildingElement'. The 'Guid' field contains '3d802fe3-ee3-4bf0-84c1-bbc5e2a7feed' and has a 'New Guid' button next to it. There are checkboxes for 'Prebuilt' and 'Foundation', both of which are unchecked. The 'AreaType' dropdown menu is set to 'Unkown'. The 'Should Allowed By Area' checkbox is unchecked. The 'MetaData' dropdown menu is set to 'None (Building Element Meta Data)'. Below this is a red warning icon and the text 'Missing MetaData'. The 'GameObject' dropdown menu is set to 'None (Game Object)'. Below this is another red warning icon and the text 'Missing m_GameObject'. The 'Layer for BuildignElement' dropdown menu is set to 'Nothing'. Below this is the text 'Selected Layers :'. The 'Layers for Collider' dropdown menu is set to 'Nothing'. Below this is the text 'Selected Layers :'. At the bottom of the panel are two buttons: 'Instantiate GameObject' and 'Create Prefab'.

The setup is easy. You have to provide the required properties to the tool and you can choose from the 2 options.

- Instantiate GameObject

With this option the BuildingElement will be instantiated in the scene.

- Create Prefab

With this option a prefab should be created to the selected path about the BuildingElement.

Note that for this the tool should instantiate the BuildingElement just like the other option but after the creation of the prefab the GameObject is removed immediately.

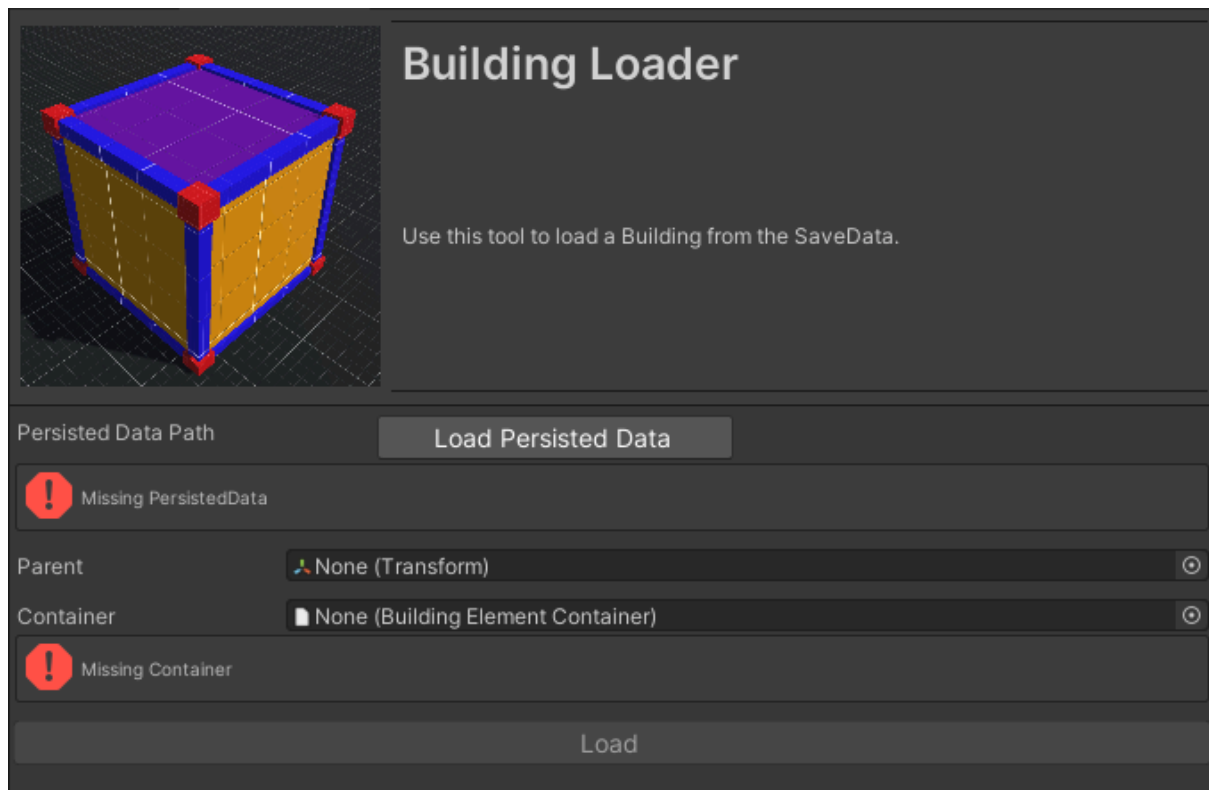

When you set the layers keep it in mind when you are using the manager the raycast should hit the BuildingElement.

Building Loader

The BuildingLoader is a complementary tool for the persistence functionality of the BuildingManager. If you have a loading file for a Building with this tool you can load it into your scene. Find it under the Tools > AdvancedBuildingSystem > Tools.

The tool works in that way you have to select a PersistedData file and a BuildingElementList (which contains every BuildingElement from the Building) should be provided and just press the Load button. It will load the persisted Building into your scene. Also you can give a parent object from the Hierarchy to be the parent of the Building.

Note that this tool can be used only when the game is running. If you do not want to run the scene this tool works totally fine with an empty scene.

ABS Statistics

The ABS Statistics is based on the IBuildingManagerStatisticsTracker. This tool gives a visual representation of the data of the Statistics feature.

This tool amplify the data of the Statistics with:

- Minimum Value
- Maximum Value
- Average Value
- Summary
