Missing Prefabs

After the import you can see similar issues in the Console.

It is because the Third Person Controller was not imported into the project.

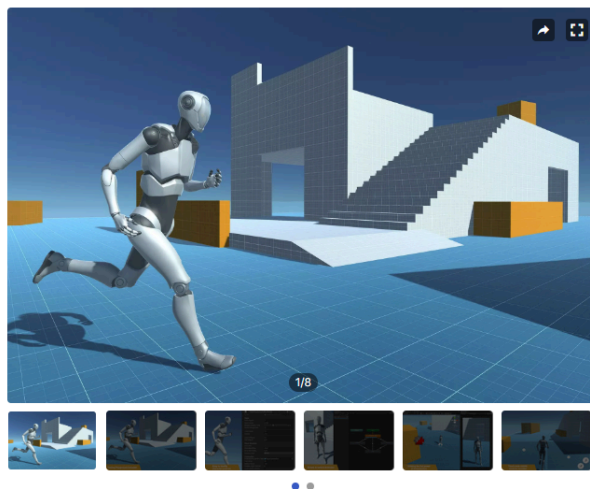

Also the Demo scene can be black like that:

The Advanced Building System does not depend on any other asset but its demo does.

Import the following free asset provided by the Unity for the Demo scene:

Home > Essentials > Starter Assets - ThirdPerson | Updates in new CharacterController package

Starter Assets - ThirdPerson | Updates in new CharacterController package

Yellow Or Black Camera

If you open the Advanced Building System you can see the following yellow scene in Unity 6.

Or the following black screen in older Unity versions than 6.

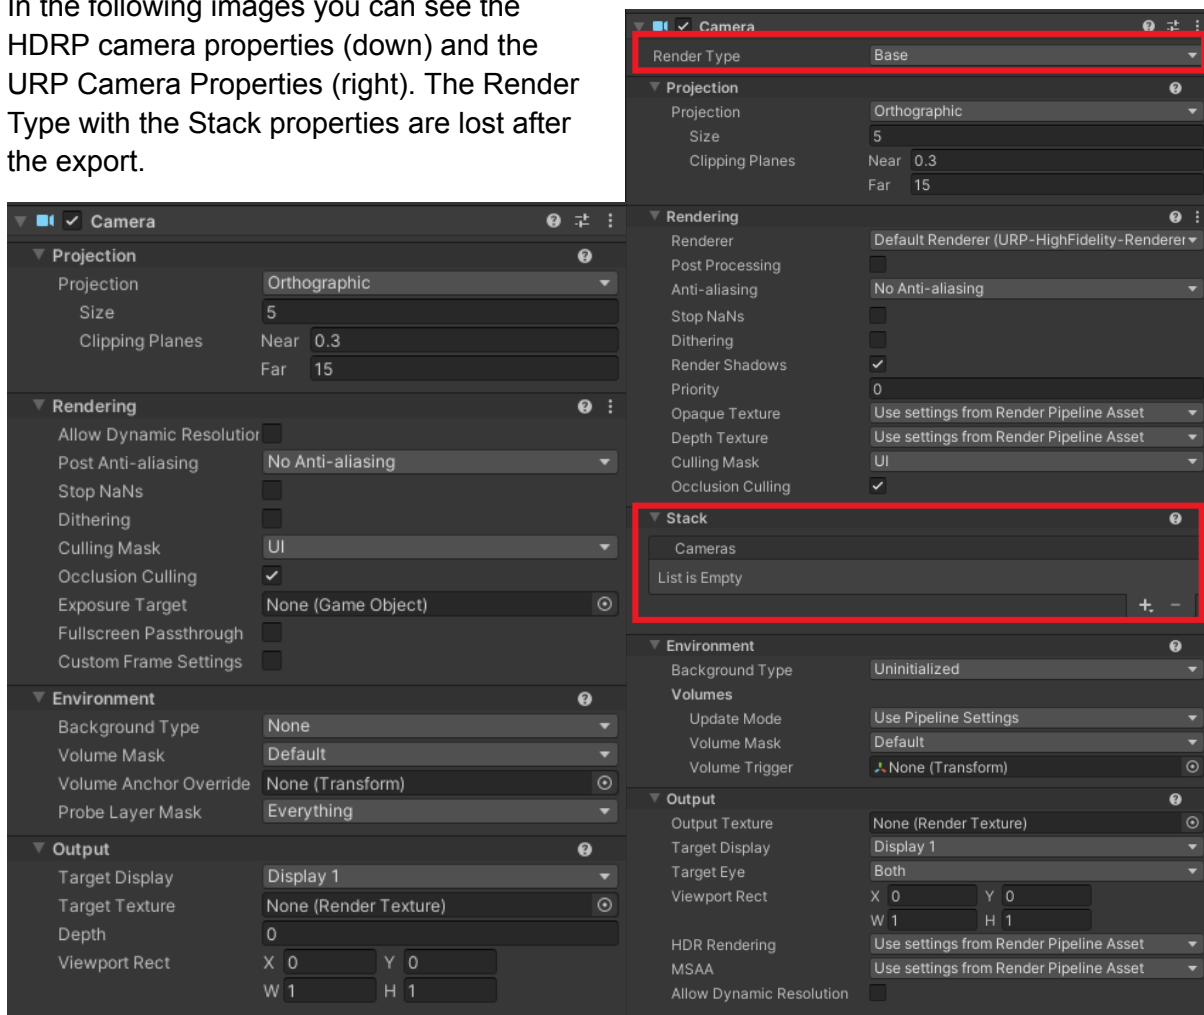

This problem can be seen if you open the demo scene in BuiltIn and URP scenes.

Cause

This is because of the HDRP support of the asset. For supporting all 3 render pipelines the asset should contain at least one scene for each render pipeline. For uploading the asset it must be validated by Unity itself. The problem is that the HDRP scene has objects that do not exist in the BuiltIn and URP projects so the asset should be validated in a HDRP because in that project every object is presented.

The issue came from the fact that the HDRP camera doesn't have some property used by the URP and the BuiltIn demo scenes. So when the asset has been exported and uploaded from the HDRP project those values have been lost.

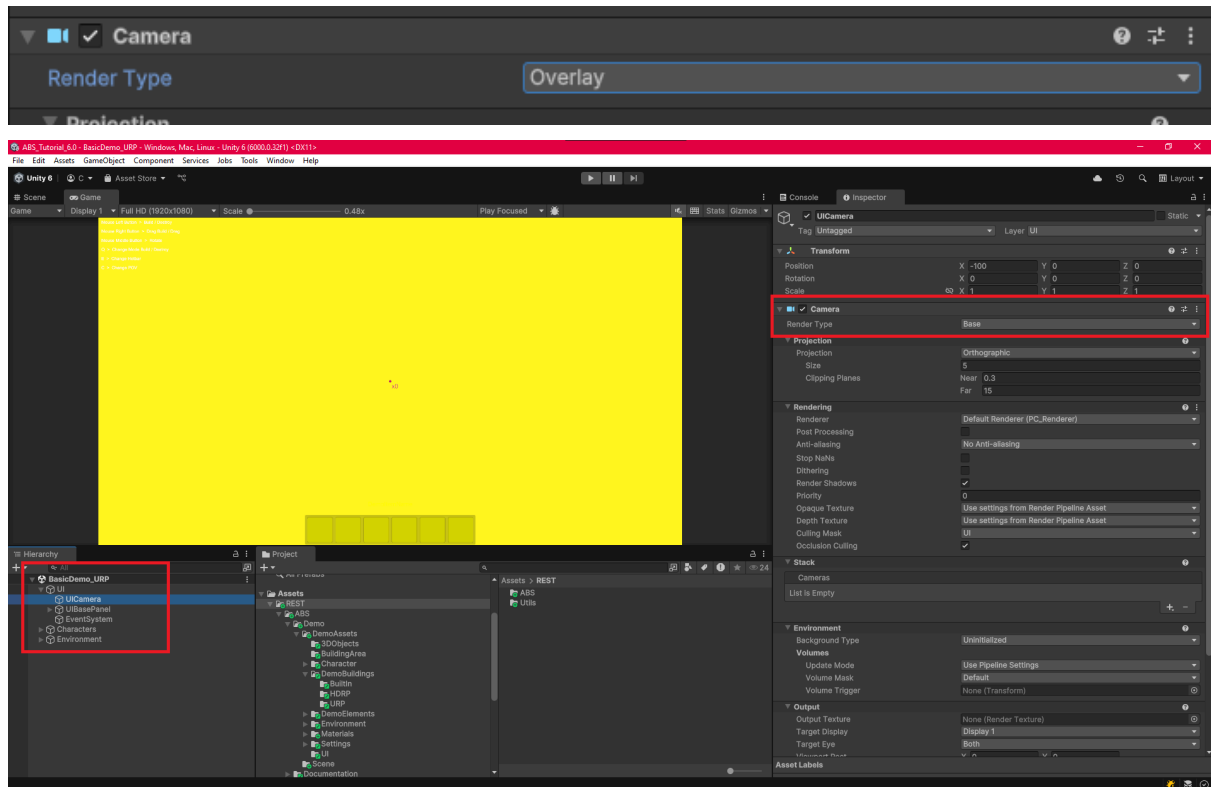

In the following images you can see the HDRP camera properties (down) and the URP Camera Properties (right). The Render Type with the Stack properties are lost after the export.

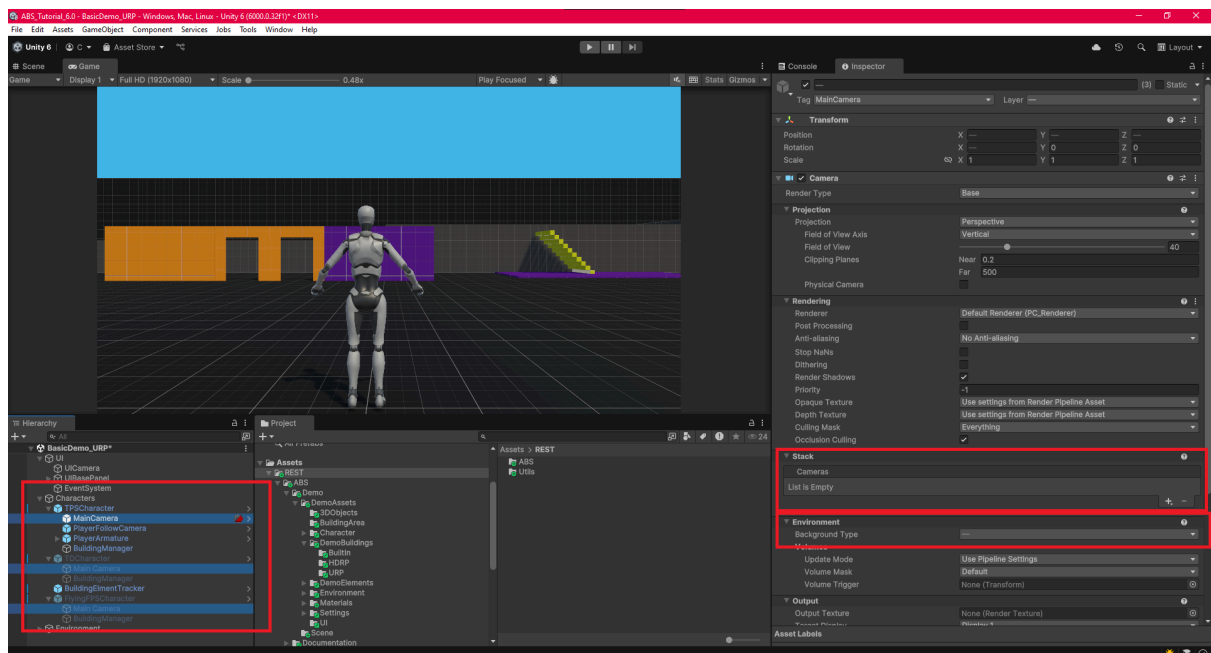

Workaround/Hotfix

Currently I'm working on how I can fix it but until that here is a short workaround how to fix the demo.

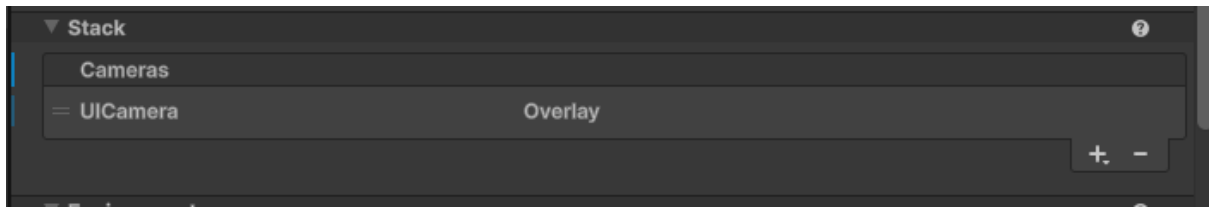

First change the UICamera's Render Type to Overlay:

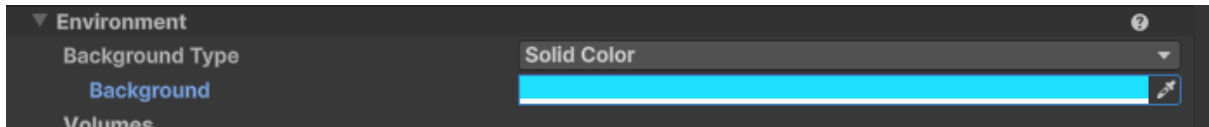

Next open all of the 3 character cameras:

Add the UICamera to the CamersList in the Stack:

Then Set the Background Type to Solid Color and choose a color:

These steps should fix the yellow camera issue:
